Side channel leakage

Secret Dependent Execution

```
def processPassword(pwd):
  if "a" in pwd:
     res = long_processing(pwd)
  else:
     res = short_processing(pwd)
   return res
```

Gain information with overall timing:

 0.5 seconds $\Rightarrow$ no a

 10 seconds $\Rightarrow$ a

Secret Dependent Execution

```
def processPassword(pwd):
  if "a" in pwd:
     res = long_processing(pwd)
  else:
     res = short_processing(pwd)
   return res
```

```
def processPassword2(pwd):
  if "a" in pwd:
    res = long_processing(pwd)
  else:
    res = long_processing2(pwd)
  return res
```

Gain information with overall timing:

0.5 seconds $\Rightarrow$ no a

10 seconds $\Rightarrow$ a

Secret Dependent Execution

```
def processPassword(pwd):
  if "a" in pwd:
     res = long_processing(pwd)
  else:
     res = short_processing(pwd)
   return res
```

Gain information with overall timing:

 0.5 seconds $\Rightarrow$ no a

 10 seconds $\Rightarrow$ a

```
def processPassword2(pwd):
  if "a" in pwd:
    res = long_processing(pwd)
  else:
    res = long_processing2(pwd)
  return res
```

Gain information with execution flow:

- Execute `long_processing` $\Rightarrow$ a
- Else, no a in pwd

Secret Independent Execution[1]

- Control flow does not depend on secret

```
if secret:
  [...]
else:
  [...]
```

[1] P. Kocher. *Timing Attacks on Implementations of Diffie-Hellman, RSA, DSS, and Other Systems.* In CRYPTO'96.

Secret Independent Execution[1]

- Control flow does not depend on secret

```
if secret:
  [...]
else:
  [...]
```

- Memory access does not depend on secret

```
x = array[secret]
```

[1] P. Kocher. *Timing Attacks on Implementations of Diffie-Hellman, RSA, DSS, and Other Systems.* In CRYPTO'96.

My Contributions

Cryptography in the Wild: The Security of Cryptographic Implementations

I. Assess the security of PAKEs implementations against microarchitectural side-channel attacks
II. Investigate the remanence of side-channel, despite their long history
III. Explore other solutions to provide secure implementations

My Contributions

Peer-reviewed:

S&P'22 User study on constant-time verification tools usage
J. Jancar, M. Fourné, D. De Almeida Braga, M. Sabt, P. Schwabe, G. Barthe, P.A. Fouque, Y. Acar

CCS'21 Password recovery attack against SRP implementation
D. De Almeida Braga, P.A. Fouque, M. Sabt

ACSAC'20 Dragonblood is Still Leaking
D. De Almeida Braga, P.A. Fouque, M. Sabt

TCHES'20 Attack on the SCP10 standard
D. De Almeida Braga, P.A. Fouque, M. Sabt

Under submission:

- Novel attack on Dragonfly, and secure implementation
  D. De Almeida Braga, M. Sabt, P.A. Fouque, N. Kulatova, K. Bhargavan

Ongoing work:

- Follow-up study on constant-time tools usability
- Prefetcher-based side-channel attack

  return (x, y)
```

Improves Upon Previous Attack

Data Leaked:

- Number of iterations to convert the password... for a set of public MAC addresses

Amount of Information:

- 2 bits on average

Practical evaluation:

- 10 measurements get reliable information

Improves Upon Previous Attack

Data Leaked:

- Number of iterations to convert the password... for a set of public MAC addresses

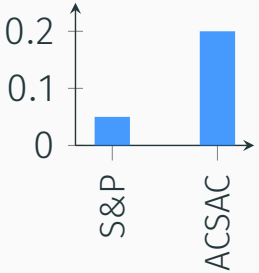
Amount of Information:

- 2 bits on average

Practical evaluation:

- 10 measurements get reliable information

Better signal to noise ratio than the original attack



Impact and Lesson Learned

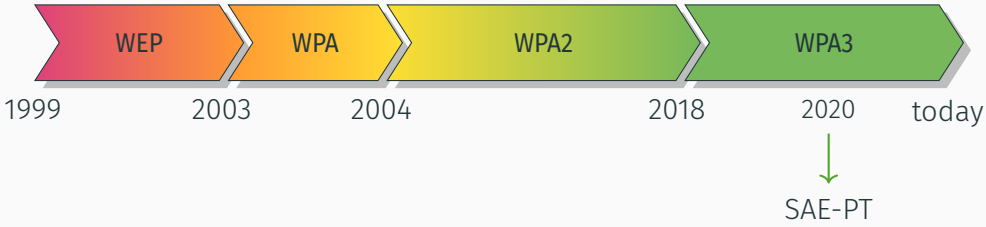
- 2 Practical attacks against iwd and FreeRadius (EAP-pwd)
  - 20 traces needed to recover a password from HaveIBeenPwned
  - ≈0.01€ on AWS instances
- 3 security patches deployed

Material available at `https://gitlab.inria.fr/ddealmei/poc-iwd-acsac2020`

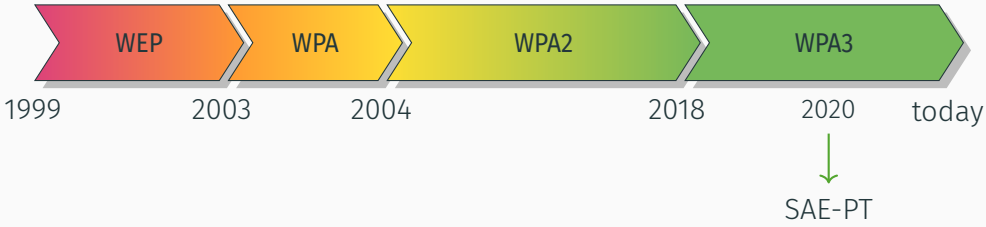
Current official recommendations do not consider microarchitectural attacks

Listen to CFRG members' warnings!

Improving the Password Conversion



Improving the Password Conversion



- Better password conversion (SSWU)
  - Deterministic
  - Straightforward constant-time implementation
- ⚠ **Not** backward compatible

Looking Under the Hood

We mostly analyzed Wi-Fi daemons...

... what about their dependencies, like crypto libraries?

A Novel Side-Channel Attack on Dragonfly Implementation and a Formally Verified Implementation

Daniel De Almeida Braga, Mohamed Sabt, Pierre-Alain Fouque,
Natalia Kulatova, Karthikeyan Bhargavan

Under submission

SAE - Probabilistic Password Conversion (EC)

```
def HuntingAndPecking(pwd, MAC_A, MAC_B, ec)

    seed = Hash(MAC_A, MAC_B, pwd, i)
    x_cand = KDF(seed, label)

  return (x, y)
```

Looking Under the Hood

```
def set_compressed_point(x, fmt, ec)
```

- Branching on the compression format
- Affects SAE (legacy version)
- 1-bit leakage
- Narrow scope outside of Dragonfly

Looking Under the Hood

`def set_compressed_point(x, fmt, ec)`

- Branching on the compression format
- Affects SAE (legacy version)
- 1-bit leakage
- Narrow scope outside of Dragonfly

`def bin2bn(buf, buf_length)`

- Skipping leading 0 bytes
- Affects both SAE and SAE-PT
- 8-bit leakage with proba 1/256
- Wide scope (targets utility function)

Looking Under the Hood

`def set_compressed_point(x, fmt, ec)`

- Branching on the compression format
- Affects SAE (legacy version)
- 1-bit leakage
- Narrow scope outside of Dragonfly

`def bin2bn(buf, buf_length)`

- Skipping leading 0 bytes
- Affects both SAE and SAE-PT
- 8-bit leakage with proba 1/256
- Wide scope (targets utility function)

Affected projects:

- hostap/wpa_supplicant with OpenSSL/WolfSSL
- iwd with ell
- FreeRadius with OpenSSL

”Obviously” Vulnerable, yet Difficult to Exploit

- Very few conditional instructions (one cache line or less)
- Many false positives with ”vanilla” Flush+Reload
- Using existing attack to create a new distinguisher

Abuse prefetching behaviors to create a new distinguisher!

Prefetcher-based Side Channel

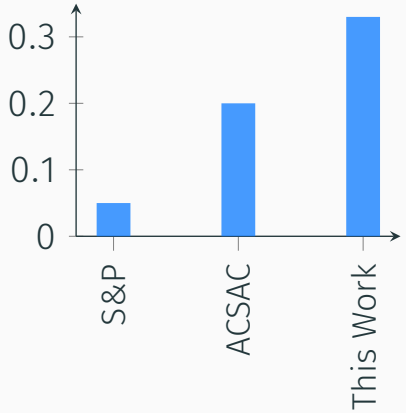
Very accurate distinguisher, with a better spatial resolution!



Sustainable patch for hostap

- Cryptographic libraries refused to patch
- Many other potential vulnerabilities (≈ 400)

Shall we replace them?

[1] J-K. Zinzindohoué et al. *HACL*: A Verified Modern Cryptographic Library.* In CCS'17

Sustainable patch for hostap

- Cryptographic libraries refused to patch
- Many other potential vulnerabilities (≈ 400)

Shall we replace them?

HaCl*: A Formally Verified Cryptographic Library[1]

- Memory-safety
- Functional correctness
- Secret independence

Impact

A New Attack

- Dictionary attack (SAE/SAE-PT)
  - Improved signal-to-noise ratio!
- New generic gadget
  - Potential impact on many low-level arithmetic functions

Impact

A New Attack

- Dictionary attack (SAE/SAE-PT)
  - Improved signal-to-noise ratio!
- New generic gadget
  - Potential impact on many low-level arithmetic functions

A Better Defense

- **3** Security patches (hostap, iwd, FreeRadius)
- Formally verified crypto implementation (HaCl*)
- Benefit from HaCl*'s team support

Limitations and Future Work

Characterize the new leakage gadget

- How accurate can we get?
- Does it work on other architectures?

Limitations and Future Work

Characterize the new leakage gadget

- How accurate can we get?
- Does it work on other architectures?

Other microarchitectural components

- Lots of candidates
- Evolving architectures

Limitations and Future Work

Characterize the new leakage gadget

- How accurate can we get?
- Does it work on other architectures?

Other microarchitectural components

- Lots of candidates
- Evolving architectures

Secure Standardized PAKEs

- OPAQUE and CPace
- Verifying early implementations
- Generating formally verified implementations

Limitations and Future Work

Characterize the new leakage gadget

- How accurate can we get?
- Does it work on other architectures?

Secure Standardized PAKEs

- OPAQUE and CPace
- Verifying early implementations
- Generating formally verified implementations

Other microarchitectural components

- Lots of candidates
- Evolving architectures

Academic - Real-World Gap

- What does make a tool usable?
- How to enforce formal verification for constant-time programming?
- Would another tool change anything?

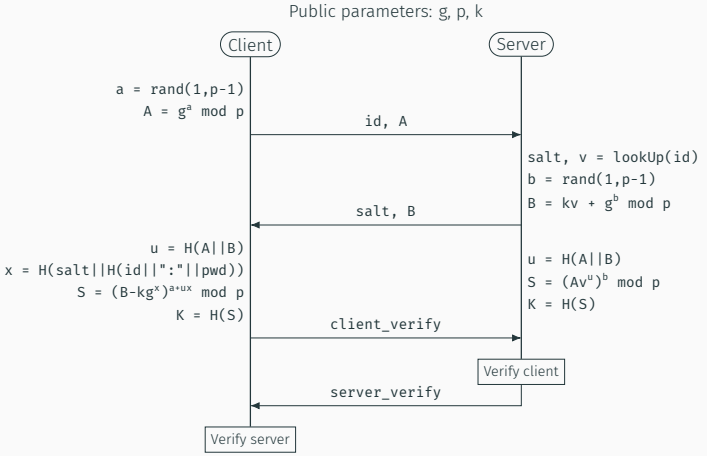
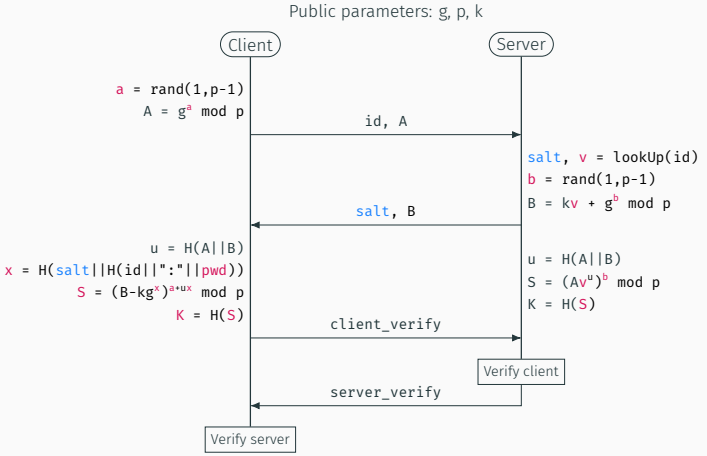
Presented at CCS 2021

SRP - A Legacy Asymmetric PAKE



SRP - A Legacy Asymmetric PAKE



Exploiting the Leakage

Attacker's Goal: Recover the password

Target: OpenSSL's modular exponentiation

Exploiting the Leakage

Attacker's Goal: Recover the password

Target: OpenSSL's modular exponentiation

Challenge: operations are *very* fast, hence tricky to reliably observe for an attacker

Solution: Identify bit patterns in the exponent, based on arithmetic overflows.

Impact and Lesson

Impact: Large impact analysis on open source projects

- 6 projects
- 10 packages/libraries
- 6 programming languages

Password	x value	Diff score

Single Measurement Attack

- Very accurate measurement
- Each bit of information halves the number of possible passwords
  - k bits of information $\Rightarrow$ false positive/negative with probability of 2^{-k}

Single Measurement Attack

- Very accurate measurement
- Each bit of information halves the number of possible passwords
  - k bits of information $\Rightarrow$ false positive/negative with probability of 2^{-k}

For an n-bit exponent, we get $k = 0.4n + 2$ bits on average (verified empirically)

SHA-1: 66 bits of information
SHA-256: 104 bits of information

Mitigations

Two choices:

- Patch OpenSSL TLS-SRP by adding the proper flag
  - Most projects use the bignum API, not the whole SRP
  - Difficult to propagate
  - Root cause of the issue remains

- Switch to a secure by default implementation (flag for insecure/optimized)
  - No flag $\Rightarrow$ secure implementation (potential performance loss)
  - All projects are patched at once

Mitigations

Two choices:

- Patch OpenSSL TLS-SRP by adding the proper flag ← OpenSSL's choice
  - Most projects use the bignum API, not the whole SRP
  - Difficult to propagate
  - Root cause of the issue remains

- Switch to a secure by default implementation (flag for insecure/optimized)
  - No flag ⇒ secure implementation (potential performance loss)
  - All projects are patched at once
